

My concept is to do a redesign of a pet sitting service I use. Their site is really outdated at the moment and not mobile friendly. I would like to turn their old site into a single page responsive product/service page. On the page I will create a new contact form and include a map of the area they currently serve. I will use formspree.io to handle the contact form and use Leaflet.js for a map of the area the company serves. I will implement the event listener when the user clicks to submit the contact form, I will hide the contact form and show the the message has been either sent or it has failed and to try again.

Third party libraries and modules I plan on using:

Bootstrap
jQuery
formspree.io
Leaflet.js
